### 1. General Description

The LB150X03-TL01 is a Color Active Matrix Liquid Crystal Display with an integral LED backlight system. This LCM has LED replaceable function. (LGD can't guarantee the LCM with the replaced LED).

The matrix employs a-Si Thin Film Transistor as the active element. It is a transmissive type display operating in the normally white mode. This TFT-LCD has 15.0 inches diagonally measured active display area with XVGA resolution(1024 horizontal by 768 vertical pixel array). Each pixel is divided into Red, Green and Blue sub-pixels or dots which are arranged in vertical stripes. Gray scale or the brightness of the sub-pixel color is determined with a 8-bit(or 6-bit) gray scale signal for each dot, thus, presenting a palette of more than 16,777,216(or 262,144) colors.

The LB150X03-TL01 has been designed to apply the interface method that enables low power, high speed, low EMI.

The LB150X03-TL01 is intended to support applications where thin thickness, low power are critical factors and graphic displays are important. In combination with the vertical arrangement of the sub-pixels, the LB150X03-TL01 characteristics provide an excellent flat display for office automation products such as PC or etc.

Note)

1. The specified current and power consumption are under the V<sub>cc</sub> = 3.3V , 25°C , f<sub>v</sub> = 60Hz condition whereas Mosaic pattern(8x6) is displayed and f<sub>v</sub> is the frame frequency.

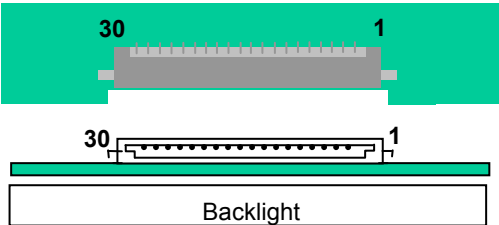

2. The current is specified at the maximum current pattern
3. The measuring position is the connector of LCM and the test conditions are under 25°C.
4. The current and power consumption with LED Driver are under the V<sub>LED</sub> = 12.0V , 25°C , Dimming of max luminance whereas white pattern is displayed.
5. The operation of LED Driver below minimum dimming ratio may cause flickering or reliability issue.
6. This Spec. is not effective at 100% dimming ratio as an exception because it has DC level equivalent to 0Hz. In spite of acceptable range as defined, the PWM frequency should be fixed and stable for more consistent brightness control at any specific level desired.
7. The life time is determined as the time at which brightness of LED is 50% compare to that of initial value at the typical LED current.

## Product Specification

Note)

1. Contrast Ratio(CR) is defined mathematically as

$$\text{Contrast Ratio} = \frac{\text{Surface Luminance with all white pixels}}{\text{Surface Luminance with all black pixels}}$$

2. Surface luminance is the center point across the LCD surface 50cm from the surface with all pixels displaying white. For more information see FIG 3.

 3. The variation in surface luminance, The Panel total variation ( $\delta_{\text{WHITE}}$ ) is determined by measuring  $L_N$  at each test position 1 through 5, and then dividing the maximum  $L_N$  of 5 points luminance by minimum  $L_N$  of 5 points luminance. For more information see FIG 4.

$$\delta_{\text{WHITE}} = \text{Maximum}(L_1, L_2, \dots, L_5) / \text{Minimum}(L_1, L_2, \dots, L_5)$$

 4. Response time is the time required for the display to transition from white to black (rise time,  $T_{R}$ ) and from black to white(Decay Time,  $T_{D}$ ). For additional information see FIG 5.

5. Viewing angle is the angle at which the contrast ratio is greater than 10. The angles are determined for the horizontal or x axis and the vertical or y axis with respect to the z axis which is normal to the LCD surface. For more information see FIG 6.

## 9. PRECAUTIONS

Please pay attention to the followings when you use this TFT LCD module.

### 9-1. MOUNTING PRECAUTIONS

- (1) You must mount a module using holes arranged in four corners or four sides.
- (2) You should consider the mounting structure so that uneven force (ex. Twisted stress) is not applied to the module. And the case on which a module is mounted should have sufficient strength so that external force is not transmitted directly to the module.
- (3) Please attach the surface transparent protective plate to the surface in order to protect the polarizer. Transparent protective plate should have sufficient strength in order to resist external force.
- (4) You should adopt radiation structure to satisfy the temperature specification.
- (5) Acetic acid type and chlorine type materials for the cover case are not desirable because the former generates corrosive gas of attacking the polarizer at high temperature and the latter causes circuit break by electro-chemical reaction.
- (6) Do not touch, push or rub the exposed polarizers with glass, tweezers or anything harder than HB pencil lead. And please do not rub with dust clothes with chemical treatment. Do not touch the surface of polarizer for bare hand or greasy cloth. (Some cosmetics are detrimental to the polarizer.)
- (7) When the surface becomes dusty, please wipe gently with absorbent cotton or other soft materials like chamois soaks with petroleum benzene. Normal-hexane is recommended for cleaning the adhesives used to attach front / rear polarizers. Do not use acetone, toluene and alcohol because they cause chemical damage to the polarizer.
- (8) Wipe off saliva or water drops as soon as possible. Their long time contact with polarizer causes deformations and color fading.
- (9) Do not open the case because inside circuits do not have sufficient strength.

### 9-2. OPERATING PRECAUTIONS

- (1) The spike noise causes the mis-operation of circuits. It should be lower than following voltage :  
 $V = \pm 200\text{mV}$  (Over and under shoot voltage)
- (2) Response time depends on the temperature. (In lower temperature, it becomes longer.)
- (3) Brightness depends on the temperature. (In lower temperature, it becomes lower.)  
And in lower temperature, response time (required time that brightness is stable after turned on) becomes longer.
- (4) Be careful for condensation at sudden temperature change. Condensation makes damage to polarizer or electrical contacted parts. And after fading condensation, smear or spot will occur.
- (5) When fixed patterns are displayed for a long time, remnant image is likely to occur.
- (6) Module has high frequency circuits. Sufficient suppression to the electromagnetic interference shall be done by system manufacturers. Grounding and shielding methods may be important to minimize the interference.

※ If Customer supply incorrect Signal/Power, LGD cannot guarantee the Quality of LCM.

### 9-3. ELECTROSTATIC DISCHARGE CONTROL

Since a module is composed of electronic circuits, it is not strong to electrostatic discharge. Make certain that treatment persons are connected to ground through wrist band etc. And don't touch interface pin directly.

### 9-4. PRECAUTIONS FOR STRONG LIGHT EXPOSURE

Strong light exposure causes degradation of polarizer and color filter.

### 9-5. STORAGE

When storing modules as spares for a long time, the following precautions are necessary.

- (1) Store them in a dark place. Do not expose the module to sunlight or fluorescent light. Keep the temperature between 5°C and 35°C at normal humidity.
- (2) The polarizer surface should not come in contact with any other object.  
It is recommended that they be stored in the container in which they were shipped.

### 9-6. HANDLING PRECAUTIONS FOR PROTECTION FILM

- (1) When the protection film is peeled off, static electricity is generated between the film and polarizer. This should be peeled off slowly and carefully by people who are electrically grounded and with well ion-blown equipment or in such a condition, etc.
- (2) The protection film is attached to the polarizer with a small amount of glue. If some stress is applied to rub the protection film against the polarizer during the time you peel off the film, the glue is apt to remain on the polarizer.  
Please carefully peel off the protection film without rubbing it against the polarizer.
- (3) When the module with protection film attached is stored for a long time, sometimes there remains a very small amount of glue still on the polarizer after the protection film is peeled off.
- (4) You can remove the glue easily. When the glue remains on the polarizer surface or its vestige is recognized, please wipe them off with absorbent cotton waste or other soft material like chamois soaked with normal-hexane.

### 9-7. PRECAUTIONS FOR LED REPLACE

- (1) It is possible to replace LED array assembly. When being replaced, defects such as stems, mechanical issue, stains and etc. can be occurred, so that the operation should be with care. After being replaced with another LED array assembly, defects are not object of warranty.
